

Dear client,

I'm testing your application "TheApp" .

I believe, I found a bug : After adding new profile photo, the previous profile photo has been deleted from the account.

I guess, this feature should work like this: After I download new profile photo, the previous one should be saved in the apps gallery in case I decide to change the photo back without uploading it again.

There is no specific information concerning this point in your application documentation.

Please, send me extended documentation with a detailed description of how this feature should work according to the latest requirements.

Thanks for your understanding, best regards, Anton.
